

Air Flow Patterns

It is essential to properly install your air cleaners to maximize the airflow in your space and best capture nuisance particulates. In most cases, we recommend installing the M-30 unit/s in positions that can criss-cross the air, exchanging air back and forth between units. If a single unit is installed in an area, we suggest installing in a position that will best capture the source of the nuisance particulates, and exchange clean air into a more desired area. Please see the illustrations below, showing different sizes of space.
